OFFICIAL VETERINARY AI DIAGNOSIS REPORT

Report ID: VET-
Date: 13/06/2026 20

FARM & PATIENT DETAILS

Farm Owner: aayush

Farm Name: om

Location: jalgoan, maharastra

Animal Tag ID: radha

CLINICAL EVIDENCE

LUMPY SKIN DISEASE (LSD)

Severity: HIGH

AI Confidence: 98%

Clinical Description

The image clearly shows numerous distinct, firm, raised nodules (lumps) distributed over the skin of the c particularly visible on the flanks, abdomen, and hindquarters. These characteristic skin lesions are pathognomonic for Lumpy Skin Disease. Some lesions appear to be crusted or showing signs of ulceratio

Prescribed Action Plan & Treatment

Immediately isolate the affected animal to prevent the spread of the virus to other cattle. Contact your local veterinary authorities without delay for official diagnosis, reporting, and to initiate control measures, which typically include vaccination programs for susceptible animals and strict biosecurity protocols. Symptomatic treatment for secondary bacterial infections of skin lesions and supportive care may be advised by a veterinarian.

Disclaimer: This report was procedurally generated by the Gemini AI Vision Model. While highly accurate, it is not a legal substitute for an in-person examination by a licensed veterinarian. Please consult a local professional for regulated pharmaceutical prescriptions.
